Summary

I build both sides of security: a network scanner, the detection rules that catch it, and the response platform its alerts land in, with rules validated against real attack traffic and benign baselines. I also test AI alert triage against prompt injection.

Projects

SOC Lab — the full detection-and-response pipeline in one command (Docker Compose)

- Runs an attack, detects it and opens the incident with four of my tools: NetScan scans a decoy, Suricata catches it with my rules, SOAR-Lite creates incidents with the attacker's address. CI runs the whole lab on every push.

AI Alert Triage — LLM triage of SOC alerts, red-teamed against prompt injection (Python, DeepSeek API, Ollama)

- Tested two models on 27 labelled alerts and 136 prompt-injection attacks; a guard I designed (dismissals must cite the SOC's own records) cut successful attacks on a local 7B model from 68% to 2%, and DeepSeek resisted all 136. Results reproduce in CI from recorded answers.

NetScan — network scanner and the rules that detect it (Python, Scapy, Suricata, Sigma)

- SYN/UDP scanning, banner grabbing and CVE matching by product version; hardened against hostile scan targets (stored XSS, CSRF, DNS rebinding); 194 tests.
- Suricata and Sigma rules at three levels of the Pyramid of Pain, tested against a recorded scan and a benign baseline built to trip them; rejected variants documented.

Sigma Detection Rules — tested detection-as-code (Sigma, pySigma, Zeek)

- Each rule must alert on real attack telemetry, stay quiet on a benign baseline and pass threshold edge cases; CI validates rules and generates Splunk, Elasticsearch and Sentinel queries.

SOAR-Lite — security orchestration, automation and response platform (FastAPI, PostgreSQL, Docker) · live demo

- IOC extraction, VirusTotal and AbuseIPDB enrichment, YAML playbooks, PDF reports; found and fixed vulnerabilities in my own platform (unsigned webhooks, stored XSS through attacker-written alert text); 88 tests.

Log Threat Detector — SIEM-style log analysis (Python, Flask, WebSockets) · live demo

- Detects brute force, port scans and anomalies across SSH, Apache and firewall logs; closed a gap where brute force on non-existent usernames raised no alert.

Email Threat Analyzer — phishing detection engine (Python, Flask, Docker) · live demo

- Scores emails 0–100 across headers, URLs, attachments and content; measured 73% detection on 414 real phishing emails (Nazario corpus) with a labelled benign control.

Experience

Software Developer (contract) — Hongkong Binxian Network Technology · 2026–present

- Built Roamr, a social app for foreigners in China, as sole developer (React Native, Supabase, Next.js admin dashboard), secured with row-level security, rate limiting, moderation and GDPR-compliant account deletion.
- Administer and develop seniorff.com (Laravel and Vue on Docker, dedicated Linux server): restored service after outages, consolidated domains, raised the Lighthouse SEO score to 100.

English Teacher (part-time) — primary school · 2024–present · about 60 students

Education and certifications

B.Sc. Software Engineering — Zhengzhou University · 2023–2027 (expected)

- CompTIA Security+ (SY0-701) — in progress, exam planned December 2026
- Google Cybersecurity Professional Certificate — October 2026
- Cisco Introduction to Cybersecurity and Endpoint Security — 2026

Skills

- **Detection and security:** Sigma, Suricata, Zeek, Splunk SPL, ES|QL, Sentinel KQL, MITRE ATT&CK, detection and prompt-injection testing, Nmap, Scapy, web security
- **Development and operations:** Python, FastAPI, Flask, SQL (PostgreSQL, SQLite), TypeScript, React Native, Next.js, Docker, GitHub Actions, pytest, Linux
- **Languages:** Arabic (native), English (fluent; IELTS 7.0, C1), French (intermediate), Mandarin (conversational), German (learning)
